WHAT IS AN INTRAORAL CAMERA?

An intraoral camera is a tool that dentists use to look at various parts of your mouth more closely. The intraoral camera is a lightweight, stylish tool which can be used in order to take quality color pictures of your teeth and gums and other parts of your mouth if necessary.

Dentists may use the intraoral camera to improve your oral health and diagnose dental issues such as tooth decay and periodontal disease, and tooth damage such as damaged or chipped tooth.

TEN YEARS WITHOUT BRUSHING CAUSES A HORRIBLE TOOTH DECADE.

PATIENT EDUCATION

You can virtually do “show and tell” in real time. This means you can take your patient on a “dental tour” of his or her mouth, ay.

ACCURATE DIAGNOSIS

With the crystal-clear, sharp images that you can take with an intraoral camera, you’ll be able to make precise diagnoses and recommended the right treatment every time.

THEY SAY IT
WE LOVE IT!

I had gone for filling my cavities.. treatment was very well done. Each and every medical person was well aware of what is the solution for the problem at hand. Doctors and staff were very supportive, quality of treating patients and way they handled the problems with patients was exceptional; go to solution for anyone with tooth problems! Clinic environment was also also warm and welcoming & definitely recommended for anyone with tooth related issues ..
