Zero cavity

DENTAL IMPLANT

what to expect?

Dental implants on your mind !!
Here is a **STEP to STEP** guide to simplify
your implant journey

zero cavity

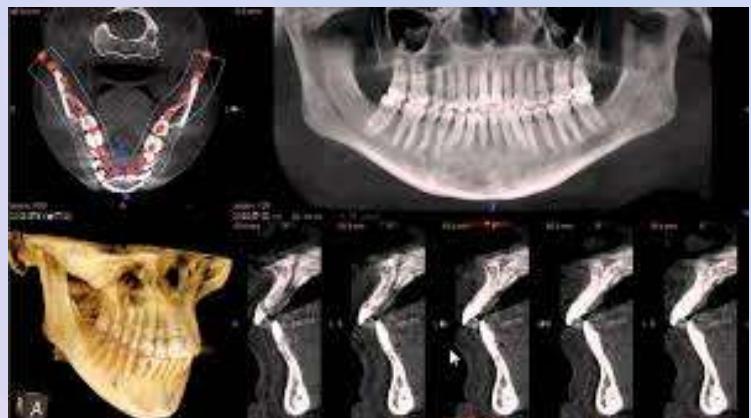

The complete DENTAL Care Center

STEP 1 INITIAL CONSULTATION, EXAM AND X-RAYS

A thorough oral examination and a review of your medical history.

The x-ray(s) and 3d scans will help diagnose any existing problems present with your teeth and help qualify the bone in the area needing implant treatment.

A simple blood test like CBC, BT CT, HBA1C etc to help foresee and handle any unique situations that can affect your implants.

After your examination and x-rays, we will sit down and review all the benefits, options and risks of all your available options. Then, together, we will develop a treatment plan designed just for you and your unique needs and preferences.

STEP 2 PRE-IMPLANT PREPARATION (EXTRACTION(S) AND/OR BONE GRAFTING)

If you're getting implants in order to replace a cracked or otherwise problematic tooth, you may need to have an extraction done beforehand.

If we are not able to place the implant at the time the tooth is removed and/or if bone grafting is necessary prior to implant placement, you'll need to give the site time to heal before getting your implant.

STEP 3 MOLDS/IMPRESSIONS

To help us plan your treatment, to prepare your temporary teeth, and make sure your implants are correctly placed, we will make a mold/impression of your teeth as they are right now, before treatment

3D scans for 3D printed models

Manual Impressions

STEP 4 IMPLANT PLACEMENT

Once you fulfill all the pre requisites for the implant procedure its time to place the implant.

Dental implant surgery can be (and very often is) done with just local anesthetic. Then we just wait for it to heal, and we will see you again in a few months

Be sure to follow the post operative instructions properly for a smooth recovery.

STEP 5 FOLLOW UP PRIOR TO FINAL TOOTH/TEETH

A few months after your implant is placed, we will see you for a follow-up exam and x-ray of the implant to confirm it's fully healed and ready to support a tooth/teeth. This visit is short and painless.

STEP 6

PLACING THE ABUTMENT: MAKING THE FINAL IMPRESSION FOR CROWN(S) / BRIDGE / ETC.

A healing abutment is placed after dental implant surgery to guide and support the healing of gum tissue, protect the implant's internal connection, and ensure the correct shape for a future restoration. It protrudes through the gum and helps form a proper gum contour, which is essential for a stable, aesthetic final restoration and overall implant success.

STEP 7

DELIVERY OF FINAL TOOTH/TEETH

This is the day we've all been waiting for. The permanent teeth are delivered and adjusted if needed, and you're done! Congratulations!

Replacing a missing front tooth with an **IMPLANT**

- Natural looking.
- Did not have to grind adjacent teeth.
- Completely safe in elders.

*They say it.
We love it.*

I have been visiting zero cavity since the last 12 years or maybe more. A visit to a dentist has always been unpleasant experience for me but not in this case....i have had 2 implants done and it was smooth....Dr Dhruti is a thorough professional, very organised and she and her team make you feel so comfortable and valued. i would recommend everyone to visit zero cavity for any dental work. i had recommended my friend's daughter who came from USA to get her implant and she had a happy experience. It's rare to get a good professional and a good human being. Lucky to have her in my life. Thank you!!

Mrs. Neeru Sehgal
